

The logo for Oracle Academy is centered on a light gray background. It features the word "ORACLE" in a bold, orange, sans-serif font. Below it, the word "Academy" is written in a smaller, dark gray, sans-serif font. The entire logo is framed by two horizontal dark gray bars, one at the top and one at the bottom.

# Objectives

- This lesson covers the following objectives:
  - Recognize and give examples of a one-to-one relationship
  - Recognize and give examples of a one-to-many relationship
  - Recognize and give examples of a many-to-many relationship
  - Recognize redundant relationships and remove them from the ERD

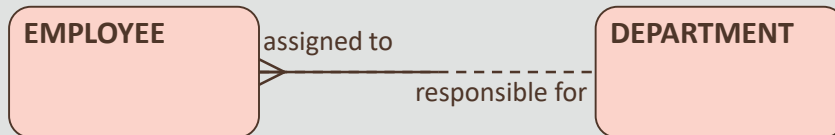

## Purpose

- Can one PERSON own many DVDs, or only one ?
- Can one DVD be owned by many PERSONs?
- As we refine and improve our model, we want to make sure our entity relationships correctly model our business rules
- Remember, you can avoid future costly mistakes by thinking through the details early on

# One-to-Many (1:M) Relationships

- The various types of 1:M relationships are most common in an ER Model
- You have seen several examples already

## Relationship Types 1:M

## 1:M Relationship

5

“Many” can mean one-or-more or zero-or-more, depending on the optionality.

Mandatory at both ends: This type of relationship typically models entities that cannot exist without each other. This usually represents an ideal situation—we cannot have ORDER ITEMS without ORDERS. Mandatory on the one side, optional on the many side: This is rarely used. You will see it only when the relationship expresses that an entity instance exists only when it is a nonempty set, and where the elements of the set can exist independently. A MUSICIAN may be part of one BAND. A BAND is of no interest if it is empty. How can you have a BAND without MUSICIANS?

# Many-to-Many (M:M) Relationships

- The various types of M:M relationships are common, particularly in a first version of an ER model
- In later stages of the modeling process, all M:M relationships will be resolved, and disappear

## Relationship Types

M:M

6

In most cases, M:M relationships indicate that an entity is missing from the model. In the next lesson, we will learn to resolve them.

# One-to-One Relationships For Roles

- Usually you will find just a few of the various types of 1:1 relationships in every ER model
- Mandatory at one end of the 1:1 relationship commonly occurs when roles are modeled

## Relationship Types

1:1

1:1 Relationships

7

Alternatively, TEACHER and STUDENT could have been modeled as subtypes of PERSON, unless a PERSON can be both a TEACHER and a STUDENT at the same time.

# One-to-One Relationships For Processes

- 1:1 relationships (of all three variations) also occur when some of the entities represent various stages in a process

## 1:1 Process Relationships

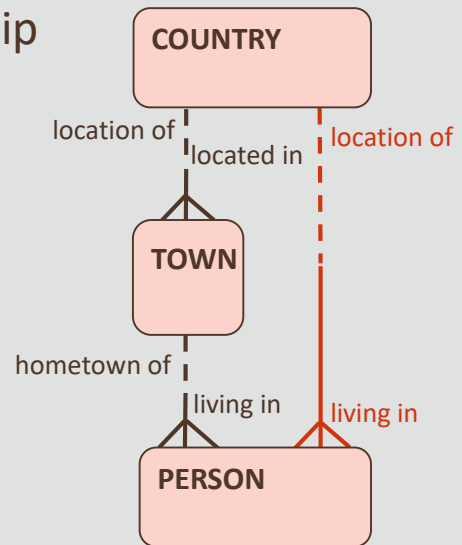

**Mandatory 1:1** A 1:1 relationship, mandatory at both ends, tightly connects two entities: when you create an instance of one entity, there must be exactly one dedicated instance for the other simultaneously.

This leads to the question why you want to make a distinction between the two entities anyway. The only acceptable answer is: only if there is a business need.

## Redundant Relationships

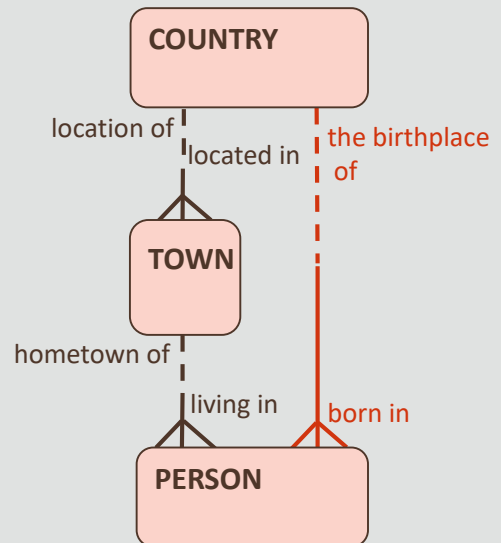

- A redundant relationship can be derived from another relationship in the model
- In this example, you can derive the relationship from PERSON to COUNTRY from the other two relationships (COUNTRY to TOWN, TOWN to PERSON), so you should remove the direct relationship from COUNTRY to PERSON

Redundancy: Something that is unnecessarily repetitive; the state of being unnecessarily repetitive

## Redundant Relationships

- However, be careful of concluding that a relationship is redundant based on the structure alone
- Read the relationships to check
- The ERD shown here does not reflect a redundant relationship

The relationship on the right tells us the country of a PERSON's birth, and the relationship on the left tells us the TOWN and COUNTRY that a person currently lives in. It is possible that someone could be living in a different COUNTRY from where they were born.

# Terminology

- Key terms used in this lesson included:
  - Many-to-many (M:M)
  - One-to-many (1:M)
  - One-to-one (1:1)
  - Redundant

## Summary

- In this lesson, you should have learned how to:
  - Recognize and give examples of a one-to-one relationship
  - Recognize and give examples of a one-to-many relationship
  - Recognize and give examples of a many-to-many relationship
  - Recognize redundant relationships and remove them from the ERD
